Dear Jo,

RE Photomontages, Graythwaite Project Application

The basis on which the photomontages may be relied upon, is as follows:

The camera position, including height, for each photomontage was measured and marked by the surveyors, who were present at the time the photographs were taken. The surveyors marked these positions on the survey and supplied this to me in CAD form.

The computer model of the proposal was constructed over this survey. Cameras within the modeling software were placed above the surveyed marks at the heights noted.

Some of the existing features within the neighbours' properties were modeled from the survey. For each photograph, the direction in which the camera was pointed was determined by adjusting the direction of the corresponding model camera until the existing features in the model lined up with their counterparts in the photographs. To demonstrate this, wire frame images of the existing features overlaid on the photographs were produced and supplied.

We have prepared photomontages using this method that have subsequently been presented in the Land and Environment court. The method has there been deemed sound.

We liaised directly with Taylor Brammer to identify existing vegetation to be removed, and to obtain information regarding the height and location of the proposed planting.

Should you require further information, I would be pleased to provide it.

yours sincerely

David Duloy
